

Growing an Urban Food Garden

edibleflint.org

Our Mission:

Edible Flint supports Flint residents in growing and accessing healthy food in order to reconnect with the land and each other.

Edible Flint programs and materials are open to all without regard to race, color, national origin, gender, religion, age, disability political beliefs, sexual orientation, gender identification, marital status or family status.

STARTING YOUR GARDEN

Site Selection

- Your site should receive at least 6/8 hours of full sun
- Easy access for equipment and supply delivery
- The garden has a water supply or access to water

Ask Yourself:

- Are there trees, homes or structures that shade the site?
- Can I get water from a neighbor?
- Who owns the property?

Site Preparation

- Start with a soil test
- Build your soil with compost and mulch

For New Lots and Community Gardens

- Find out who owns the property (<https://flintpropertyportal.com/> for City of Flint)
- Research the History of the site

Ask Yourself:

- Could previous land use have caused soil contamination?
- Was it ever a gas station, laundromat, or dry cleaners?
- Was there a house that may have been painted with lead based paint?
- Were cars or construction equipment ever parked on the site?

SUN- Pick the sunniest spots for your garden! A south-facing wall will warm quickly in the spring and be perfect for heat-lovers like tomatoes and peppers in the summer. Spots with at least 4 hours of sun may work for leafy greens.

PLANNING YOUR GARDEN

- For beginners, start small and keep your garden simple.
- Draw a plan of your garden. Using graph paper works well.
- Know where, when and how to plant. Use resources like the local library, extension websites, seed packages and other resources to know how big each plant will be by the end of the season. This will help you plan how much space you will need between plants and rows.
- Plan how you and others will walk through your garden to water and weed without stepping on the plants.
- Taller crops such as corn should be planted in the north section of your garden so that they don't shade smaller plants.

SOIL TESTING

Test the soil for chemicals like lead. Testing the soil will also tell you what nutrients are in your soil and if any should be added.

If the test results indicate

- Safe soil- then begin to prepare your soil for planting.
- Unsafe level of toxins- consider another site or an above ground gardening option like raised beds or container.

For information on how to read your soil test results visit [MSUsoiltest.com](https://www.canr.msu.edu/resources/soil_test_kit_self-mailer) or call the MSU Lawn and Garden hotline 1-888-678-3464

Improve your soil

- Good soil is the key to healthy plants. If you have limited money or time, put those resources into improving your soil.
- When breaking ground in the spring, delay preparing your soil when the ground is wet. If you work the soil when it is too moist it can become hard and compacted which will limit plant growth. Try this test; take a handful of soil and if you can press it into a sticky ball- it's too moist- wait until the soil is drier. If soil is too dry, a ball will not form.
- If more nutrients are needed, based on your soil test results, then natural vegetable composts and soil enhancers like lime or sulfur can be added to the soil.
- Work the compost and/or soil enhancers in to your garden by turning over your soils to a depth of 8 to 12 inches to loosen the soil and prepare for growing plants.

Taking a Soil Sample

1. Dig 6 inches down

2. Collect Sample

3. Sample Multiple Spots

4. Combine samples and mix

5. Place 1 cup of mix in plastic bag

Soil tests can be purchased from Michigan State University Extension. Go to https://www.canr.msu.edu/resources/soil_test_kit_self-mailer

WHAT TO GROW

What to Grow

- Grow Vegetables that you and your family enjoy.
- Talk to neighbors and other gardeners about what grows well for them.
- Ask local nurseries for the types of vegetables that have few pest problems and grow well in your climate.
- The size of your garden tells you how many and what type of plants you can grow.
- If you have limited space grow crops that are small but very productive like snap beans, tomatoes, lettuce, greens, carrots and peppers.
- Look for dwarf, bush or compact plants.
- Plants that grow on vines, like pumpkins, winter squash and melons, require lots of room and are not the best choice for small gardens although they may be trellised vertically.
- Salad greens and herbs used for food are some of the easiest plants to grow.

12 Easy Crops

Green Beans
Peas
Radishes
Lettuce
Greens
Summer Squash
Tomatoes
Peppers
Beets
Cilantro
Basil
Chives

Cool Weather Crops

Peas, Lettuce, Spinach, Kale, Swiss Chard, Broccoli, Collards, Cauliflower

Warm Weather Crops

Tomatoes, Peppers, Melons, Cucumbers, Eggplant

Colorful Vegetables and Herbs

Lavender, Basil, Lettuces and Greens, Swiss Chard, Scarlet Runner Bean

Succession Planting

It's a lot of work when your whole garden is ready to harvest at the same time. Space out your harvest by planting vegetables that produce for a few weeks at a time. It's a good idea to save space in your garden to add seeds (lettuce, peas, radishes) every few weeks to extend the harvest time.

Rotating your Crops

Rotating your crops every year (changing the location of plants within your garden) helps to control insects and disease.

Easy Rotation Reference

LEGUME
peas, beans
etc.

ROOT
onions, carrots,
beets etc.

FRUIT
Tomatoes, peppers,
squash etc.

LEAF
lettuce, cabbage,
spinach etc.

PLANTING YOUR GARDEN

HOW TO PLANT

Direct Sowing

Planting seeds directly into the soils is called direct sowing. Planting directions are printed on most seed packages. The directions will tell you how far apart to plant seeds and how deep to plant them.

Transplanting

Transplants are plants that have begun to grow in containers. You can purchase them from a nursery or grow them yourself in a protected environment. Transplants need to be hardened off. Hardening off is exposing the plant to the outdoors little by little. For a few hours during the day, set the transplants in a shady area of your garden or yard that is protected from the wind and sun. Over the next seven days, slowly move the transplants into full sun.

- Planting seeds and transplants depends on weather.
- Cool Season vegetables prefer cool temperatures and their seeds need cool soil to sprout.
- The seeds of warm season vegetables don't grow well in cool soil. These plants need a longer warmer growing season. Cool weather will slow the growth of these tender vegetables and frost can kill them. Buying warm weather crops as small plants from a local nursery insures that you will harvest before the cooler weather stops the vegetables from ripening.
- Starting your plants from seeds will lower your costs and offer the widest variety. Although, some planning is required to have the space, tools and time to start them indoors.

Planting Tips

- Plant your transplants in the evening or on a cloudy day.
- Dig a hole for each transplant a little larger than the container.
- Carefully remove each transplant from the containers one at a time and place them into the ground at the same depth they were in the container.
- Gently push the soil around the plant with your hand. Do not tamp or stomp the soil around the plant.
- Water them thoroughly one at a time. Be careful to not wash away surrounding soil.
- To prevent weeds, place mulch around the plants, being careful to keep it away from the plant's stem.

Thinning

Pulling out extra seedlings to make space for full grown plants.

Thinning is best done when the seedling has two sets of 'true' leaves. True leaves look like the leaves on the mature plant.

Pinch or cut off the unwanted seedlings at soil level instead of pulling them out. Doing this insures that you won't disturb the roots of surrounding plant.

TENDING TO YOUR GARDEN

WATERING YOUR GARDEN

- Usually plants need an inch or more of water weekly. In hot weather, check your plants daily. If the soil is dry a few inches down or if your plants are wilting then use more water. Young plants are likely to need more water, especially on sunny days.
- Water gently and directly at the bottom of the plant. Begin with 20 minutes or until soil is damp 3-4 inches below the surface. A watering can, wand on the end of a house, or a soaker hose will help protect plants from strong blasts of water. Plants in containers dry out more quickly than in garden soil.
- Water in the morning to prevent disease or plant stress.

PEST AND DISEASE MANAGEMENT

When you have any growing success in the garden, you will have to address pests - insects and animals that will also want to share in this food source - or diseases that may appear. There are many ways to deal with garden pests and disease and there are simple steps to deal with pests.

- **Scout:** To best address pests you need to keep an eye out for pests. Look for signs that pests are in your garden. This could be holes chewed in leaves or plants disappearing depending on the size of the pest.
- **Identify:** Figure out what the pest is to best stop them. To identify pests, you can watch for them and snap a picture or use an online tool like MSU Extension Ask An Expert which is a free resource. Find at <https://www.canr.msu.edu/outreach/ask-an-expert>
- **Treat:** Make sure you know what you dealing with before applying any pesticide. Treatment could mean trapping, removing by hand, fencing, using an insecticide, and more.

MULCHING AND WEEDING

Weeds compete with your food plants for water, nutrients, space and light. Stopping them from growing is the best strategy to ensure healthy plants.

- Two inches of mulch is ideal.
- Weeding will be easier if you mark your plants. This way you won't confuse your plants with weeds and remove them accidentally.
- Pulling weeds is easier after rainfall or watering.
- One trick to keep weeds in check is to set aside 10-15 minutes of every day for weed pulling. It's also great exercise!
- Pull weeds before they produce seed.

Mulch can be any material that you spread on the soil surface to help control weeds, save water and feed the soil. Possible mulches include: grass clippings (as long as you don't use chemicals), leaves, newspaper, straw and compost.

HARVESTING

HARVESTING

- Check your garden often for ripe produce; you'll enjoy it more!
- Pick in the morning. Vegetables picked during the hottest part of the day may not last as long.
- Pick during dry weather & allow the surface of the vegetable to dry, as wet produce is more prone to rot in storage.
- Pick vegetables at their peak flavor and nutrition level.
- Learn when to harvest different vegetables. Think about what you plant and when it will be ready so you aren't too busy at harvest time.
- Try freezing, canning or storing some vegetables in your basement or cellar. If you have extras, share with your friends, neighbors, local shelters or food bank.

PRESERVING THE HARVEST

When you have lots of vegetables coming out of your garden, you may be overwhelmed with tomatoes or peppers. Canning, freezing and other methods will help you enjoy your garden after you're all done gathering from the garden. Check your canning equipment and supplies. Current and safe equipment is critical for the success and safety of your preserved foods. Also, equally important for preserving food at home is reliable and safe preservation information.

Use recipes from reliable sources featuring recipes that are tested for safety. Information on canning is available from MSU Extension or by visiting the National Center for Home Food Preservation. <https://www.canr.msu.edu/outreach/>

Vegetables can be blanched before being frozen in airtight containers or plastic storage bags. After rinsing vegetables, place vegetables into boiling water and allow the water to return to a boil. Remove the vegetables after 1-2 minutes at a boil and place into ice water. When the vegetables are cooled, place them on cloth or paper towels to dry. Package blanched vegetables into airtight bags and place in the freezer. Some vegetables, like tomatoes, onions, peppers, and fresh herbs, do not need to be blanched before freezing.
